- Eliminates double handling of toxic materials and emptying of vacuum container
- Eliminates need for cloth and granular absorbents and their disposal problems
- Easy to clean; the pump can be completely disassembled
- Easily switches from vacuum mode, filing the container, to empty mode by turning the dial on top of the unit
- Instant On/Off control from air valve
- Automatic float valve to prevent overfilling

INADEQUATE PIPING & HOSES INFORMATION

The largest pressure loss in a system serving air tools is found in two areas: hoses that are too long and hoses that are too small. The longer the hose, the more friction is created, regardless of size; this can be addressed by increasing hose size. For this reason, small diameter hoses inevitably limit flow. Choosing the proper diameter hose for the distance and flow required will go a long way to limiting pressure loss at the tool.

AIR PREPARATION

The lay-out of air-supply piping, the selection of adequate hose sizes and appropriate fittings and couplers and the preparation of air before it enters a tool are very important.

Why efficient treatment of compressed air at the work station is vital?

The harmful agents in a compressed air system are:

LIQUIDS & CONDENSATES:

- Cause line corrosion
- Cause reduced performance of tools and cylinders
- Cause lubricants to wash away

COMPRESSOR OIL:

- Forms corrosive acids from lubricant aerosols
- Forms sticky emulsions, reducing tools' speed and performance
- Forms clogging residues

SOLID CONTAMINANTS:

- Cause premature wear and damage to controls, tools and cylinders
- Cause seizing and scoring of cylinders and air powered motors

Proper air preparation will result in improved performance and increased tool life.

SEE PAGES 1148-1172 FOR AIR TOOLS

FILTERING, REGULATING & LUBRICATING AT THE WORK STATION

Compressed-air treatment program units and modular components are indispensable to insure maximum efficiency of controls, pneumatic tools, air cylinders and other pneumatic equipment.

THEY ALLOW:

- To prolong pneumatic equipment life as well as of air cylinders
- Proper filtering and lubricating of air prolong their life and top performance by a ratio of 1 to 20
- Increase tools and equipment performance up to standard of efficiency, by preventing damages due to overheat and seizure
- They insure a dependable source of smooth vibrationless power to operate tools at an efficient and steady speed
- To reduce downtime, therefore improve the overall performance and efficiency of any compressed air system, tools, air cylinders or other pneumatic equipment

Proper usage of compressed air calls for:

FILTERS/MICRO COALESCING:

- To remove moisture and particles

REGULATORS:

- To control pressure for the particular use

GAUGES:

- To show pressure

LUBRIFICATORS:

- To protect power tools by injecting a metered quantity of lubricant

Components may be purchased separately or in pre-assembled combinations

AIR LINE FILTERS

A filter is a necessity in every compressed air system. Filters remove the danger of corrosive damage to air tools and equipment by removing condensed moisture, pipe scale, dirt and rust from the air stream.

AIR LINE FILTERS

Selection:

- Filter element rating is the prime selection criteria
- For most industrial applications, filter elements rated at 40 micrometres are adequate
- When necessary, filtration down to 20 or 5 micrometres or finer can be provided
- However, finer filtration increases pressure drop through the element
- Next, the flow capacity and pressure rating of the filter should be considered
- Finally, port size should match piping to avoid unnecessary pressure drops through restricting adapters
- Filter should be located as far from the compressor as possible to trap as much condensation as possible

MICRO COALESCING FILTERS

- Used in compressed air systems that require compressed air virtually free of oil vapours
- Remove liquid aerosols and very small particles
- The efficiency of removing such liquid aerosols is as high as 99.9%
- A pre-filter should always be used to increase life and efficiency of micro mist filters
- Typical application: Paint spraying

PRESSURE REGULATORS

Operation:

- Pressure regulators are used in compressed-air systems to reduce system pressure to a level suitable to operate air tools and equipment
- Regulators maintain the reduced pressure despite changes in the inlet pressure and changes in downstream flow requirements
- Pressure regulators reduce line pressure to a usable range, at a lower pressure than the compressor is set to deliver
- Regulators maintain a steady flow of air regardless of the fluctuations that may take place in line pressure
- Pneumatic equipment or tools operating at higher than recommended pressure, waste the energy to generate that pressure
- It creates a potential safety hazard and the tool will wear out prematurely. Operating below specified pressure can cause the tool to fail to meet performance specifications, therefore, precise air pressure control is essential for efficient operation of compressed air equipment

Selection:

- Inlet pressure rating and downstream controlled range, as well as flow capacity must be determined before selecting a regulator
- Port size should match piping size
- Required response time relieving capability and type of adjustment are other considerations

AIR LINE LUBRICATORS

Operation:

- Most pneumatic tools require oil lubrication for proper operation and long service life
- Too little oil can cause excessive wear and premature failure
- Too much oil is wasteful and can become a contaminant
- Intermittent lubrication may be the worst situation because the oil film can dry out to form sludges and varnishes on internal surfaces
- Lubricators protect expensive power tools
- Lubricators are ideal for lubrication of air tools or equipment, they inject a finely divided "fog" of oil into the air stream
- External adjustment and visible sight dome make precise adjustment easy
- This unit should be located as close as possible to the tool or the point where lubrication is required, a lubricator should never be located between compressor and filter or regulator, or on an air line supply to a paint gun
- Whenever possible, lubricators should be located at an elevation higher than the tools being lubricated

COMBINATION FILTER/REGULATORS

Operation:

- Filter/regulators are used in compressed air systems to filter air and to regulate pressure
- Filter/regulators combine the functions in one compact, space saving unit

COMBINATION FILTER/ REGULATOR/LUBRICATOR

Selection:

- When selecting the individual filter/regulator/lubricator unit, the air consumption of the tool(s) to be serviced should be appropriate with the flow capacity of the unit
- Filter/regulator/lubricator should be as close as practical to the tool or work station
- Filter/regulator/lubricator should be in an area of easy accessibility because these units require regular maintenance
- A shut-off valve (ball valve) should be installed ahead of the unit to facilitate maintenance
- An air line may be equipped with the best filters and lubricators available, but if they are not positioned in the system where they do the most good, or if filters are not drained, or if lubricator reservoirs are not re-filled, the money spent for their use may have been wasted

POPULAR COMBINATIONS

FILTER/REGULATOR + LUBRICATOR OR FILTER + REGULATOR + LUBRICATOR

Typical application: Air tools

- These units are ready for immediate installation into the air line

FILTER/REGULATOR + MICRO COALESCING FILTER

Typical application: Paint spraying

- This unit is ideal for body shop operations where filtered, dried and regulated air supply is necessary for painting
- This unit provides the painter with a clean, moisture free air supply and saves money

FILTERS/REGULATORS/LUBRICATORS (GAUGE INCLUDED)

- High-flow capacity reduces costly pressure drop
- Compact size allows greater design flexibility
- **Heavy-Duty:** High-capacity performance featuring rugged design for the most demanding applications

DESICCANT AIR DRYER SYSTEMS

TOPRING

Nevada 3 stage desiccant system is engineered to provide high-quality air. Effective for removing liquid condensate (dirt, oil, water) but ideal for removing residual water vapour and aerosols. Delivers extremely dry compressed air without the use of electricity or refrigerants. Silica gel provides maximum moisture absorption. System consists of the following: filter (5 micrometres) with auto drain, coalescing filter (0.7 micrometre) with auto drain, desiccant dryer (30 CFM capacity) with sight glass indicating need for service, pressure regulator with gauge and mounting bracket.

SPECIFICATIONS:

Max. Working Pressure: 250 PSI
Port Size: 1/2" NPT
Air Flow Capacity: 30 SCFM

3 STAGE FILTRATION:

1. Centrifugal unit removes water, oil and dirt particles down to 5 micrometres
2. Coalescent filters out oil and water aerosols and smaller dirt down to 0.3 micrometre
3. Desiccant dryer removes all remaining water vapour

Model No.	Description	Price /Each
TZ906	3-stage heavy-duty desiccant system	**P.O.A.**
TZ907	Desiccant silica gel (5 lbs.)	**144.00**

STANDARD DUTY DESICCANT SYSTEMS

TOPRING

The standard duty desiccant system offers the same benefits as the heavy-duty system, but is designed for less frequent use. It is also a 3-stage system engineered to provide high quality air. It removes dirt, water, oil, and uncondensed moisture from compressed air lines. Very efficient at protecting expensive and sensitive air tools. Does not require electricity or refrigerants to provide extremely dry compressed air. Silica gel provides maximum absorption, which can be monitored through a small sight glass. When the blue gel turns pink, the gel is then saturated with water and should be replaced with fresh gel to allow the system to remain effective. System
consists of a filter (5 micrometres) with auto drain, coalescing filter (0.1 micrometres) with auto drain, desiccant dryer, filter/regulator with gauge, and a safety slide valve.

SPECIFICATIONS

Max. Working Pressure: 175 PSI
Port Size: 1/2" NPT
Air Flow Capacity: 20 SCFM

3 STAGE FILTRATION:

1. Integral filter/regulator removes particulates down to 5 micrometres in size, to protect the regulator, which then reduces the pressure to the desired pressure setting
2. Coalescing filter removes 99.99% of oil aerosols and microscopic particles down to 0.1 micrometres in size
3. Desiccant dryer removes all remaining water vapour and a 40 micrometre filter element removes traces of any desiccant dust before it leaves the system

IN-LINE LUBRICATORS

SAVES MONEY - INCREASES EFFICIENCY

In-line lubricators save money by reducing down time on air operated equipment. They also avoid the cost of wall mounted lubricating systems. They increase efficiency by preventing sticking of the working mechanism, power loss caused by inadequate lubrication and by keeping the internal mechanism properly oiled.

- Directly attached to the air tool
- Slotted adjustment screw for oil adjustment
- Automatic lubrication of air upon passage of rated air flow
- Operates in any position
- Will not leak lubricant into air line upon pressure drop or when disconnected from air line

Applications

- Ideal for air tools
- Especially recommended for staplers and nailers

Construction

- Hard anodized aluminum, steel and nylon

STANDARD DUTY

Pneumatic tools and appliances cannot maintain their full efficiency if the mechanism is impaired by corrosion, condensation or lack of lubrication.

- Max. working pressure: 120 PSI

ANTI-VIBRATION CUPMOUNTS

Industrial cupmounts provide excellent protection against severe impact shock, vibration and noise.

- High vibration dampening characteristics
- Fail-safe, rugged interlocking metal and neoprene construction provides exceptional performance against shear and compression forces and flexible vertically and stable horizontally
- Metal cupmount component is cold-rolled steel coupled with an elastomer-in-compression design
- High-grade neoprene elastomer provides resistance to oil and ozone
- Each side flange has through holes allowing for effective attachment to supporting equipment structure

ENDURO-FLEX™

The one step finishing disc

- One-step finishing discs not only meet but surpass the challenges that the metal fabricating and finishing industry faces daily
- Ultra sharp and refined zirconium grain stays sharper longer to remove more material faster
- Special top coat continuously cools and lubricates the disc for smooth, vibration-free grinding and sanding from start to finish
- **With Spin-On arbor**: Will not smear or contaminate the work piece; patented backing has now even more reinforcing ribs for added safety; packing can be trimmed down easily for a customized feel
- **With 7/8" arbor**: Quiet and vibration-free grinding; complete control and total operator comfort; will not smear or contaminate the work piece; flexible backing wears down without the nuisance dust often associated with fibreglass backed discs
- Always use flange model **UG580**

FLAP WHEELS

Typical Applications

- Metal fabrication
- Blending welds
- Deburring
- Cleaning and finishing

Conformable to most shapes

Designed to deliver a consistent finish with a uniform rate of cut, Norton flap wheels wear away, continually exposing fresh abrasive. Conformable to most shapes, they are available in coarse to fine grit.

COOLCUT™ FLAP WHEELS

These flap wheels are made of the highest industrial quality abrasive cloth and have an optimal number of flaps that are securely bonded and balanced around the hub for highest quality finishing. They are ideal for general purpose blending, shaping and deburring and will give a consistent and uniform grained satin finish in no time.

BRISTLE DISCS

Bristle discs are ideal for safely cleaning and stripping a wide variety of substances off of metal. The discs will easily cut through hardened enamel, paint, thick dried adhesives, and layers of corrosion, without destroying the underlying material or compromising safety with dangerous flying wires.

In addition, bristle discs do not clog up with substances being removed, and give consistent finishes throughout the life of the discs.

All bristle discs are colour coded by grade and are made of nylon embedded with abrasive to create an abrasive action. Each disc is flexible and easily conforms to contours and tight corners and angles.

ROLOC™ BRISTLE DISCS

- Uniform concentration of mineral throughout the flexible abrasive filled bristles
- Fast cut rate and long performance life for removal of rust, coatings, and flashing
- Roloc™ attachment method for quick and easy disc changes
- All discs feature a 5/8" trim length and are embedded with Regalite™ abrasive mineral

SCOTCH-BRITE™ SURFACE CONDITIONING FILE BELTS

Premium Scotch-Brite™ surface conditioning non-woven web.

Designed for:
- Cleaning
- Finishing
- Light deburring

Recommended Operating Speeds:
Generally, low speeds are recommended for generating very uniform satin finishes, finishing aluminum alloys without lubricants, and woodworking applications. Higher speeds are recommended when removing imperfections prior to buffing. High belt speed will result in faster cut along with finer finishes.

Decorative finishing	500-3000
Wood sanding	1200-2700
Deburring	5000-6500

Application	Recommended SFPM*

END BRUSHES

Especially suited for use on portable air and electric tools, CNC and robotic equipment, the end brush is designed for work where space limitations are a factor. In most applications, higher speeds (up to 25 000 RPM) are required for effective brushing action. Osborn® end brush fill materials include carbon and stainless steels, brass, natural fibre, abrasive nylon, and TY® elastomer encapsulated wire.

OD - OUTSIDE DIAMETER

Standard Osborn® end brushes are made with outside diameters from 3/16" through 3". For larger surfaces or "surround" applications, multiple brushes may be clustered. As a guide, add 1/8" to brush O.D. to get overall O.D.

T - TRIM LENGTH

Shorter brush section provides stiffness and faster cutting. Longer filaments have more flexibility for irregular surfaces.

OAL - OVERALL LENGTH

Distance from end of brush part to end of shank.

S - SHANK DIAMETER

All standard end brushes have 1/4" diameter shank. Miniature end brushes have 1/8" diameter shank.

CRIMPED WIRE END BRUSHES

- Engineered to operate at high speeds
- **Applications:** Rubber and Plastic Mold Cleaning/ Cleaning Pipe I.D./Removing Rust, Weld Scale and Spatter/Cleaning Castings/Burr Removal/Rubber Flash Removal/Carbon Removal/Spot Facing/ Cleaning and Finishing Recessed Areas

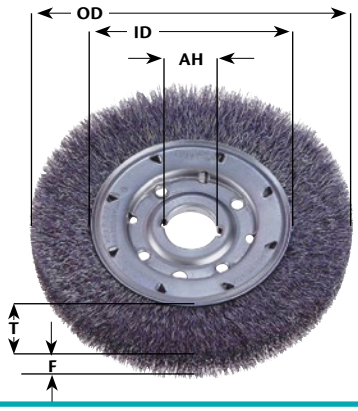
AH - ARBOR HOLE

Osborn® brushes are made with a variety of standard sizes which can easily be adapted to fit any standard spindle.

OD - OUTSIDE DIAMETER

Standard Osborn® wheel brushes are made with outside diameters from about one inch to almost two feet. Generally, the largest diameter that suits your work space and machine speed will be most efficient.

ID - INSIDE DIAMETER



Assuming a fixed O.D., increasing the I.D. produces a stiffer, less flexible brush.

T - TRIM LENGTH

Shorter trim makes a stiff, fast cutting brush. Longer trim makes a more flexible brush for irregular surfaces.

F - FACE WIDTH

Standard face widths range from extremely narrow to several inches wide. Many styles can be mounted in multiple.

CRIMPED WIRE WHEEL BRUSHES

- Can be mounted horizontally or vertically
- Highly flexible, ideal for light to medium duty surface preparation on irregular surface
- Offered a variety of style from aggressive material removal to surface conditioning and polishing

AH - ARBOR HOLE

Most cup brushes are available with either plain or 5/8-11NC threaded arbor holes, while a few styles feature a hexagonal opening, and smaller sizes are fitted with a 1/4" shank.

OD - OUTSIDE DIAMETER

Standard Osborn® cup brushes are made in a range of outside diameters from 2" to 9". Generally, the largest diameter that suits your work space and machine speed will be most efficient.

T - TRIM LENGTH

The length of the fill material that extends beyond the metal cup or bridle. A short trim length provides a stiff, fast-cutting brush, while a longer trim length offers flexibility for dressing irregular surfaces.

R - ROW COUNT & ALIGNMENT

Cup brushes are available with one, two, or three rows of filaments or knots. Unless otherwise identified as "Stagger Row," multiple rows are parallel. Stagger row brushes provide more aggressive action.

CRIMPED WIRE CUP BRUSHES

Designed for light and medium-duty applications on a variety of high speed air and electric tools. Offers smooth, responsive cutting action at all speeds on a variety of jobs.

WITH 1/4" SHANK - LIGHT DUTY

- Offers light duty cleaning action on air tools or electric high-speed portable tools
- All brushes have a 1/4" shank

CLARKSON OSBORN

WARWICK NPT (NATIONAL PIPE THREAD) TAPS

Applications:

For tapping tapered pipe threads. This is the most common of all pipe tap styles. The tapered thread form creates a pressure-tight joint when used with a sealant.

WARWICK NPTI (INTERRUPTED NATIONAL PIPE THREAD) TAPS

Application:

HSS interrupted thread pipe taps are designed for tapping soft or tough stringy metals that tend to load threads with chips. Interrupted thread pipe taps start with a few full threads and then have every other thread removed along the thread helix to provide more chip space, better lubrication, and to reduce drag.

WARWICK NPTF (DRYSEAL NATIONAL PIPE THREAD) TAPS

HSS taper pipe taps are designed for tapping ferrous and non-ferrous fittings used to connect pipes carrying fluids or gases and other places where very tight fits are needed. NPTF taper thread pipe taps do not require sealants. Dryseal is attained by metal to metal contact.

WARWICK NPTS (STRAIGHT NATIONAL PIPE THREAD) TAPS

Application:

HSS straight thread pipe taps (NPTS) are designed for tapping holes or couplings for low pressure work that will adjust at assembly to the taper of external threads. A sealant must be used to secure a pressure-tight joint.

HOLE DOZER™ HOLE SAW

ICE HARDENED™ HOLE SAWS

Utilize a proprietary cryogenic hardening process that improves upon traditional heat treat processes. Unlike surface coatings that wear away, cryogenics harden to the core by minimizing soft metal (austenite) and creating more hard metal (martensite).

Feature and benefits:

- Ice Hardened™ for up to 50% longer life than the competition
- Optimized tooth form for up to 2x faster cutting
- Functional slots for faster plug removal
- Matrix II bi-metal teeth for greater durability

WHAT YOU SHOULD KNOW ABOUT CIRCULAR SAW BLADES

Tooth design is the determining factor in deciding which blade is best for which industrial application.

Here's a quick overview of how subtle changes in bevel, gullet and kerf affect cutting performance.

BEVEL

Teeth can have a single bevel, two bevels or no bevel at all. Types of bevels can alternate from tooth to tooth on a given blade. The bevel is what gives the blade its specific cutting pattern.

GULLET

This is the space between teeth that clears the work piece of chips after the cut. The deeper the gullet, the more efficiently chips are cleared.

KERF

This is the face of the tooth, where the actual cutting takes place. The pattern of alternating kerfs, known as the grind, decides what applications a blade is best for.

GRIND

There are many types of grinds, but the five basic ones are:

Flat top grind (FTG) - best for ripping.

Alternate top bevel (ATB) - for crosscutting, cut-off and trimming.

Triple chip grind (TCG) - perfect for hard, abrasive materials like non-ferrous metals, hardwoods and plastics.

Multi-purpose carbide tipped (MCT) or ripping and crosscutting, mitre.

Tri-grind (TRI) - combination grind.

INDUSTRIAL BLADES

TCS

Feature Freud's newest and most resilient Permashield® coating. This blade now combines Freud's highest quality blade with its highest quality coating. The TCS coating helps reduce blade distorting heat and makes cutting a breeze.

PLIER HOLD-DOWN CLAMPS

Quick action pliers offer excellent workholding capacity, they are portable to many applications and highly versatile. Only normal hand pressure is required to close and lock clamps in place. Clamp thickness may be adjusted by turning the threaded spindle. Once set, the clamp can be used repeatedly at that opening. Standard style clamps open by pulling handles apart. Trigger release style pull the two-way release (up and down) for easy one-handed release.

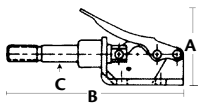
424 SERIES

Has a single 1/4-20 adjustable neoprene-tipped spindle assembly. Clamp opens by manually pulling handles apart.

462 SERIES

Two trigger release clamp includes 3/8-16 steel swivel foot adjustment spindle assembly.

STRAIGHT LINE CLAMPS

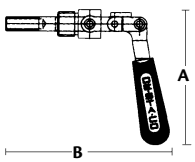


Popular in assembly operations or used in conjunction with welding jigs. Straight line clamps provide quick, strong holding force. Most clamps lock in two positions allowing them to be used as a push or pull clamp.

601, 603 & 609 SERIES

These models can be bolted or welded to a flat surface. Plungers extend out to clamp material against a fence or square surface. Model **TN103** includes a 8-32 nylon spindle assembly (**TN126**). Model **TN105** plunger is tapped for 5/16-18 adjustment spindle (not provided). Model **TN107** plunger is tapped for 5/16-18 neoprene tip or other custom fixture.

Series 603

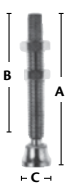


Series 601

602 & 604 SERIES

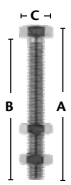
Fully retractable locators mount directly through a member by a jam nut on the work side or flush by drilling and tapping the member, a flat surface is not required. Locks in extended or retracted position. When flush-mounted, plunger completely retracts from work area.

REPLACEMENT SPINDLES & ACCESSORIES



FLAT-TIP BONDED NEOPRENE CAPS

Adjustable spindles provide a cushion between clamps and clamped item. Neoprene tip resists oils and chemicals and has a durometer of 60-70 and an operating temperature of -40°F to 220°F. Each spindle includes two adjusting nuts.

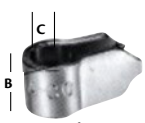


SWIVEL FOOT ADJUSTING SPINDLES

Used primarily for model **TN102** plier clamp, but may be used with any clamp with the proper thread size. Steel swivel shoe provides a firm clamp and is suitable for more heavy-duty applications. Includes two adjusting nuts.

HEX HEAD ADJUSTING SPINDLES

Carbon steel fully threaded adjusting spindles are used in applications where a neoprene or swivel type spindle is not necessary. A neoprene cap foot is available for all sizes. Two adjusting nuts included.



FLANGED WASHERS

Carbon steel replacements for U-bar clamps only.

BOLT RETAINERS

Carbon steel replacements for S solid hold-down bars.

NEOPRENE CAPS

Slip-on heads of hex nut spindles, durometer 60-70 and operates between -40°F and 220°F.

IMPROVE CLAMPING VERSATILITY & SAFETY

WILTON MAGNEFIX VISE JAW CAPS
TEMPORARY WORK-HOLDING SYSTEMS

- Designed to protect both the vise jaws and the workpiece from marring and distortion during any clamping application
- Caps are constructed from a hardened aluminum alloy with two built-in circular permanent magnets on the backside which hold the product securely to the vise
- The caps are magnetic towards the vise side to prevent steel filings from attaching themselves to the jaws and keep the clamped part from becoming magnetized

MODEL A - ALUMINUM MAGNEFIX JAW CAPS

- Aluminum alloy design includes six grooves to compensate for the unevenness of the workpiece
- Deeper Vee-Groove ensures more secure clamping of circular work pieces
- Use together with Rubber Magnefix Jaw Caps when clamping taper pins and spherical parts

MODEL F - FIBER FACE MAGNEFIX JAW CAPS

- Aluminum alloy with laminated fiber cover to prevent the absorption of outside materials
- Heat parts rapidly by concentrating heat into part
- Use on workpieces to avoid distortion and clamping marks

MODEL R - RUBBER FACE MAGNEFIX JAW CAPS

- Aluminum alloy with synthetic rubber cover
- Jaw cap conforms to workpiece and grips firmly without slipping while protecting work surface
- Use in combination with aluminum and prism jaw caps to clamp taper pins or tapered workpieces

MODEL P - PRISM MAGNEFIX JAW CAPS

- Jaw construction includes a 120° horizontal Vee-Groove, three vertical Vee-Grooves and a 90° groove for marking out and centre punching
- Ideal for light tapping and thread cutting applications

QUICK-CONNECTS FOR WELDING EQUIPMENT

Western's Quick-Connects provide fast, reliable and positive connections and quick disconnections for torches, hoses and regulators. All models are color-coded for gas service for added safety (oxygen/green, fuel gas/red, inert gas/blue). Oxy/fuel gas models include integral reverse flow Check Valves. Quick-Connects fit all B-size welding and cutting equipment.

FEATURES & SPECIFICATIONS:

- Brass construction provides long service life– cycle tested over 10 000 operations indicating a service life of 10 to 12 years of comparable use
- Non-interchangeable Oxygen and Fuel Gas connectors prevent accidental gas mixing
- Instant closure on reverse flow Check Valves with total shutoff at only 10 oz. of back pressure
- Exceed CGA flow specifications–1100 SCFH flow at 125 PSIG inlet pressure and 800 SCFH flow at 125 PSIG inlet pressure when 2 additional check valves are used in conjunction with the Quick-Connects
- Spring loaded locking mechanism responds to fingertip action and achieves a gas-tight connection
- For inert gas models, demand valve on supply side creates a positive seal when fitting is not connected
- Double seal socket connection on second seal provides added safety protection

GAS LENS COLLET BODIES

- Eliminates turbulence in the gas shielding stream as it emerges from the nozzle, better shielding patterns
- Long stable stream allows the electrode to be extended farther beyond the end of the nozzle for improved visibility of the weld zone

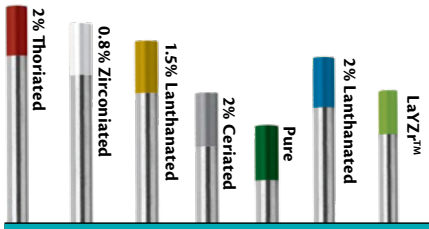
TUNGSTEN ELECTRODES

- Oxides used are primarily zirconium, thorium, lanthanum or cerium
- Additions are 1% - 4%, improve arc initiation, especially when direct current (DC) welding is employed
- Thorium oxide (thoria), effective in terms of long life and thermal efficiency
- Zirconium oxide (zirconia) has been commonly used for alternating (AC) TIG welding, welding aluminum
- Electrode length: 7"
- **Each package contains 10 electrodes**

2% THORIATED:
- Good current capacity, arc stability and easy arc start on DC current
- High resistance to weld pool contamination
- Maintains sharpened tip configuration
- Not normally used on AC current because it is difficult to maintain the balled end

0.8% ZIRCONIATED:
- Excellent for AC welding due to the higher arc stability
- High-resistance to weld pool contamination
- Excellent balled end retention
- Handles higher current with less spitting
- Better arc starts and arc stability than pure tungsten



1.5% LANTHANATED:
- Lowest erosion rate • Wide current range
- No spitting • Best DC arc starts and stability

2% CERIATED:
- Excellent arc starting, stability, long life and higher-current capacity than thoriated tungsten
- Operate successfully with AC or DC current
- Non-radioactive • Low erosion rate
- Wide current range • No spitting

PURE:
- Lowest current capacity and least expensive
- Maintains a clean balled end for welding on AC
- More prone to weld contamination than other types of tungsten electrodes
- Tends to spit at higher currents • Used for non-critical welds only

2% LANTHANATED:
- Non-radioactive
- Best general purpose electrode at medium to higher amperages for both A/C or D/C using inverter or transformer based constant current power sources
- Good for low-alloyed steels, non corroding steels, aluminum alloys, magnesium alloys, titanium alloys, nickel alloys, and copper alloys
- Good arc starts and stability, low erosion rate, medium to high current range

LAYZR™:
- Non-radioactive
- Best for automated or robotic applications in A/C or D/C due to low voltage tolerance (changes in tip to work piece distance) using inverter or transformer based constant current power sources
- Good for low-alloyed steels, non corroding steels, aluminum alloys, magnesium alloys, titanium alloys, nickel alloys, and copper alloys
- Very stable tip geometry runs cooler than 2% thoriated, longer life
- Very best low amperage starts

STAINLESS STEEL GAS SHIELD FLUX-CORED WIRE

weldcote metals

Precisely formulated for all-position versatility with a smooth arc, good wetting and overall operator appeal. Products conform to AWS Specification A5.22.

308LT1-1

Most frequently used for base metals of similar composition such as AISI Types 301, 302, 304, 305 and 308.

309LT1-1

Used for welding similar alloys in wrought or cast form; occasionally, to weld Type 304 base metals when severe corrosion conditions exist; and, at times, welding dissimilar steels.

316LT1-1

Used for welding similar alloys (containing about 2% molybdenum); also for high temperature service applications (the presence of molybdenum provides increased creep resistance at elevated temperatures).

VERSAFILLER™ WATER FOUNTAIN & BOTTLE FILLERS

Enjoy the best of both water options; refreshing fountain water and a bottle filler unit for refillable bottles. The VersaFiller™ accomplishes both tasks with ease and simplicity, and puts your location at the top of the refillable bottle trend while making a bold statement about your concern for the environment.

The VersaFiller™ is also designed for the future. The alcove and activation button contain Freshield™, which utilizes a silver-based antimicrobial compound. This is ideal for work-place settings, schools, university locations, and any public building.

The VersaFiller™ unit is available in two configurations. The **ON557** (PWSBF) model can be retrofitted to existing **OA059** (P8AC) coolers as well as Elkay's EZ8 models (some installation is required to connect this unit to existing P8AC models) providing an instant upgrade to those products already in the field.

The **ON557** (PWSBF) is also designed for simplicity of installation, requiring only water tubing connection to the host (P8), with no required electrical connections or separate drains.

The VersaFiller™ can be purchased as a complete top and bottom combination as well, **ON555** or **ON556**.

STANDARD FEATURES:

- Waterways are lead-free in materials and construction
- Heavy-duty galvanized steel frame bolts directly to the wall
- Freshield™ antimicrobial compound
- Gauges: Panels: 22, frame: 16
- ADA compliant for adult or child when properly installed

SMARTWASHER®

SmartWasher® uses the process of **bioremediation** - the accelerated break down of organic compounds such as grease, grime, varnish, oil, carbon and other heavy industrial soils through the use of nonpathogenic microbes. The microbes, suspended in a fluid that re-circulates through the unit, literally **eat their way through soils**, converting them into harmless water and carbon dioxide (CO_2). The solution remains clean and usable, unlike traditional solvent-based systems where the solution becomes dirty and less effective over time. Disposal becomes a non-issue, as hazardous waste streams are eliminated.

IMPORTANT

Actual drill sizes cannot be shown because drilling varies with hardness of metal. Drill sizes indicated on drawings are merely a guide. Exact drill size can only be determined by sample drilling of the actual metal. When drilled to proper tolerance, the serrated edge of the fitting will provide a secure, lasting grip.
